The Struggle with Product Data is Real

Despite the widespread adoption of PIM and MDM systems over the last few decades, companies still face big challenges meeting growing customer demand for their products.

At Pivotree we resolve these challenges by going beyond PIM and MDM system implementation with a data foundation that's built by expert taxonomists, automation tools that can deliver channel-ready data quickly and cost-effectively, and we integrate this data by directly delivering it to your system of choice.
SKU Build Delivers High Quality Data at Scale and Speed

SKU Build accelerates product onboarding, reduces SKU onboarding costs, and ensures you can scale quickly to meet market demand. It’s faster, better, and cheaper than doing it in-house.

Here’s How Your Product SKUs are Built and Automated

**SKUs Modeled.**
Creating a strong foundation is essential. The data models are built by Pivotree taxonomists using generative AI to ensure consistency and data governance across the board. Your needs, industry standards and competitor product data points are all taken into account.

**SKUs Automated.**
We streamline the SKU build process with automation to ensure the data is complete, accurate, and delivered with unprecedented speed.

Machine learning and generative AI ensures robust and tailored product descriptions, and complete and consistent attribute data across SKUs, categories, and manufacturers.

**SKUs Connected.**
Our integration tools can connect to any system so that your data goes where it needs to be. In most cases, this will be your PIM or MDM. It may also be your eCommerce platform, or your order or warehouse management system.

Say goodbye to high costs and manual processes.  
Say hello to clean, complete, channel-ready data when and where you need it, at breathtaking speed.
